

Welcome to Community Summit. This session is 50 Tips in 50 Minutes for Dynamics 365 Customer Service. Let people settle in. Before you start: some features in this deck are in preview or rolling out by region, so check your own environment before promising anything to users.

Here's the deal for the next fifty minutes: fifty practical tips, one minute each, in five blocks of ten. Every tip is something you can configure or try in your own environment, and each slide tells you where the setting lives. Screenshots come from Microsoft Learn so you can find the same page later. I'll keep moving, so hold questions for the end, or jot down the tip number and we'll come back to it.

Abe Saldana has spent the last 15 years building on Microsoft CRM and Dynamics 365 Customer Engagement, from CRM 4.0 through 2011, 2013, 2015 and 2016 to today's Dynamics 365. He has worked on large-scale projects for global companies across Sales, Customer Service and Marketing, covering administration, customization, C# development and complex migrations. His Power Platform work spans model-driven apps, canvas apps and Power Pages portals. Abe also brings strong requirements scoping and analysis skills, and he regularly supports pre-sales teams with solution design and work estimates. More recently his focus has moved to AI-driven solutions and intelligent automation: building conversational agents in Microsoft Copilot Studio and designing Microsoft 365 Copilot agents. That makes him a natural guide to the Copilot and AI agent features we'll cover today.

Beau Lewis leads the Business Applications practice, where he architects and delivers enterprise solutions across Dynamics 365 and the Power Platform. His experience spans Customer Service, Sales, Field Service and Project Operations, along with canvas and model-driven apps, PCF components and Power Pages. On the Azure side, he designs integration architectures that keep Dynamics 365 in sync with legacy and third-party systems in real time, using Azure Functions, Logic Apps, API Management, Front Door and SSIS, plus Microsoft Entra identity work, including Okta integration. Beau is known for aligning technical roadmaps with business goals on large-scale programs, including a project management platform that supports 5,000 tax professionals. He has also led his practice's AI and automation strategy, using Azure AI Foundry and Copilot Studio to improve the user experience and automate complex business processes. That puts him right at the center of the Copilot and agent capabilities we'll explore today.

Session Objectives

COMMUNITY SUMMIT

1. Identify and implement at least 10 "quick win" configuration changes to the Customer Service workspace to reduce clicks and handle cases faster.
2. Understand how to refine routing rules, knowledge article structures, and SLA configurations to improve first-call resolution and customer satisfaction.
3. Discover the 'hidden' AI and productivity settings that are often overlooked but can have a massive impact on daily agent workflows.

@ 2026 Dynamic Communities

Three things I want you to walk away with. First, quick configuration wins: things you can switch on next week without a project. Second, a clear picture of which Copilot and agent features are generally available today, and how to roll them out in a way your operations and compliance teams will be comfortable with. Third, a practical checklist: settings to review, two deprecations that land this month and next, and the resources to keep up after today.

Five blocks, ten tips each. Workspace and productivity tools first, then omnichannel, routing and channels, then Copilot for service representatives, then AI agents, and finally supervisors, quality and administration. Roughly ten minutes per block. Some features are in preview or rolling out by region, so check your own environment before promising anything to users.

Block one is the workspace itself: the screen your reps live in all day. Everything in these ten tips is configuration, not code, so most of it can be changed this week. We'll go from experience profiles at the top, down through session templates, the inbox, macros and scripts, and finish with a free training kit. Roughly ten minutes for this block. As we go, think about which of these your team already uses and which ones you've been meaning to switch on.

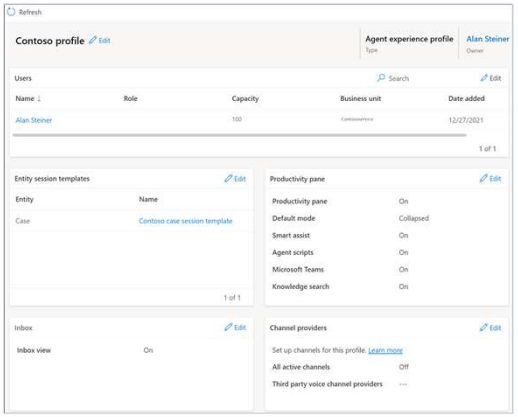

Use experience profiles instead of building custom apps

COMMUNITY SUMMIT

TIP 01 / 50 · WORKSPACE AND PRODUCTIVITY

Experience profiles give each team its own session templates, channels and productivity tools inside one workspace app, so there is far less to build and maintain.

Where: Copilot Service admin center → Support experience → Workspaces

@ 2026 Dynamic Communities

Start here because almost everything else in this block hangs off the experience profile. Instead of building a separate model-driven app for each team, create a profile per team and assign it to users or roles. The profile decides which session templates open, which channels the rep sees, and which productivity tools are on, including Copilot. On screen you can see one profile with its users, its session template and the productivity pane settings in one place. Profiles move between environments with solutions, so build them in dev and promote them like anything else.

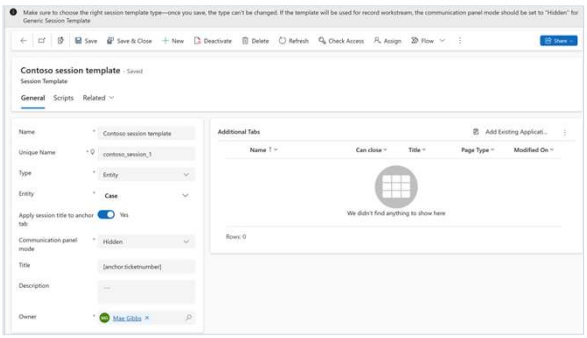

Source: Configure experience profiles — https://learn.microsoft.com/dynamics365/customer-service/administer/create-agent-experience-profile

Build a session template for each channel

COMMUNITY SUMMIT

TIP 02 / 50 · WORKSPACE AND PRODUCTIVITY

Set the anchor tab (for example, Customer summary) and add application tabs that open automatically, so reps get the right context the moment a session starts.

Tip within the tip: Give generic templates a channel icon so reps can spot WhatsApp vs. chat at a glance.

@ 2026 Dynamic Communities

A session template decides what opens when a rep accepts a chat, a call or a case. The anchor tab is the first tab and it drives context for everything else, so pick it deliberately: customer summary for conversations, the case form for cases. Add the extra application tabs reps always open by hand. Session templates are associated with workstreams, and any tab you mark as required can't be closed by the rep. The small tip: give your generic templates a channel icon so reps can tell WhatsApp from web chat at a glance in the session list.

Source: Manage session templates — https://learn.microsoft.com/dynamics365/customer-service/administer/session-templates

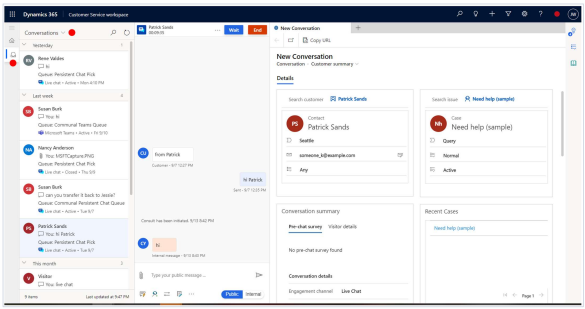

Turn on the inbox for high-velocity work

COMMUNITY SUMMIT

TIP 03 / 50 · WORKSPACE AND PRODUCTIVITY

The inbox lists cases, conversations and activities in one place, including async channels like SMS, WhatsApp, Teams and persistent chat. Promote an item to a full session when it needs more time.

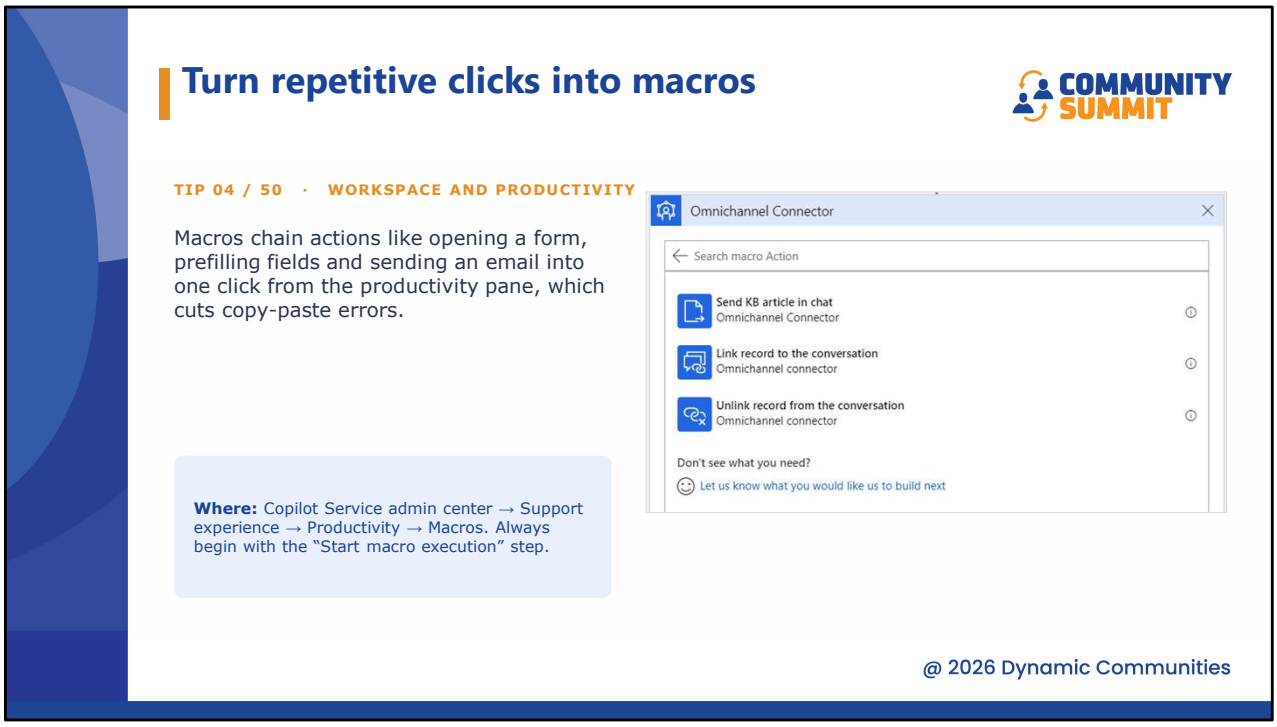

Where: Enabled per experience profile

@ 2026 Dynamic Communities

The inbox is a different way of working: instead of one session per item, reps work down a list. It's built for teams that handle lots of short asynchronous interactions, email-heavy teams or anyone on SMS, WhatsApp, Teams or persistent chat. Reps can read and reply right in the inbox and promote an item to a full session when it needs more room. You turn it on per experience profile, so you can pilot it with one team first. Admins can also define views and sorting so the most urgent work rises to the top.

Source: Use the inbox — https://learn.microsoft.com/dynamics365/customer-service/use/use-inbox

Macros are the quickest productivity win in the product. Watch a rep for ten minutes and note anything they do the same way every time: open a form, prefill three fields, send a templated email, link a record to the conversation. That's a macro. You build them in a designer with connector actions like the Omnichannel connector on screen, and reps run them from the productivity pane. Every macro starts with the Start macro execution step. Permissions trip people up: designers need Productivity tools administrator; reps need Productivity tools user or Customer Service representative.

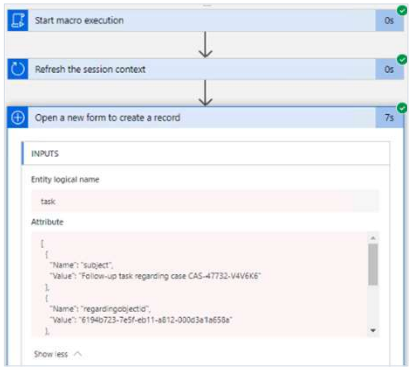

Source: Configure macros to improve representative productivity — https://learn.microsoft.com/dynamics365/customer-service/administer/macros

Refresh the session context inside macros

COMMUNITY SUMMIT

TIP 05 / 50 · WORKSPACE AND PRODUCTIVITY

Session context is cached when the session starts. If a macro updates a record and then reuses its values, add “Refresh the session context” between the steps.

Example: Update the case title, refresh, then create a task that uses the new title.

@ 2026 Dynamic Communities

This one is a common reason macros seem to use old data. The session context, the values a macro reads like the case title or customer name, is captured when the session starts. If your macro updates a record and then uses that record's values in a later step, it will read the old cached values unless you refresh. The fix is one step: Refresh the session context, which you can see in the run history on screen between Start and Open a new form. Example: update the case title, refresh, then create a follow-up task that uses the new title.

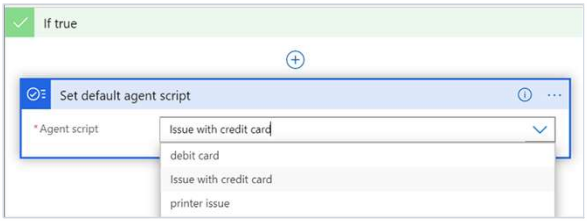

Source: Use session connector macros — https://learn.microsoft.com/dynamics365/customer-service/administer/macros-session-action

Guide reps with scripts, and set a default

COMMUNITY SUMMIT

TIP 06 / 50 · WORKSPACE AND PRODUCTIVITY

Scripts walk reps through a consistent, company-approved flow and can run macros along the way. Use a build expression on the session template to pick the default script.

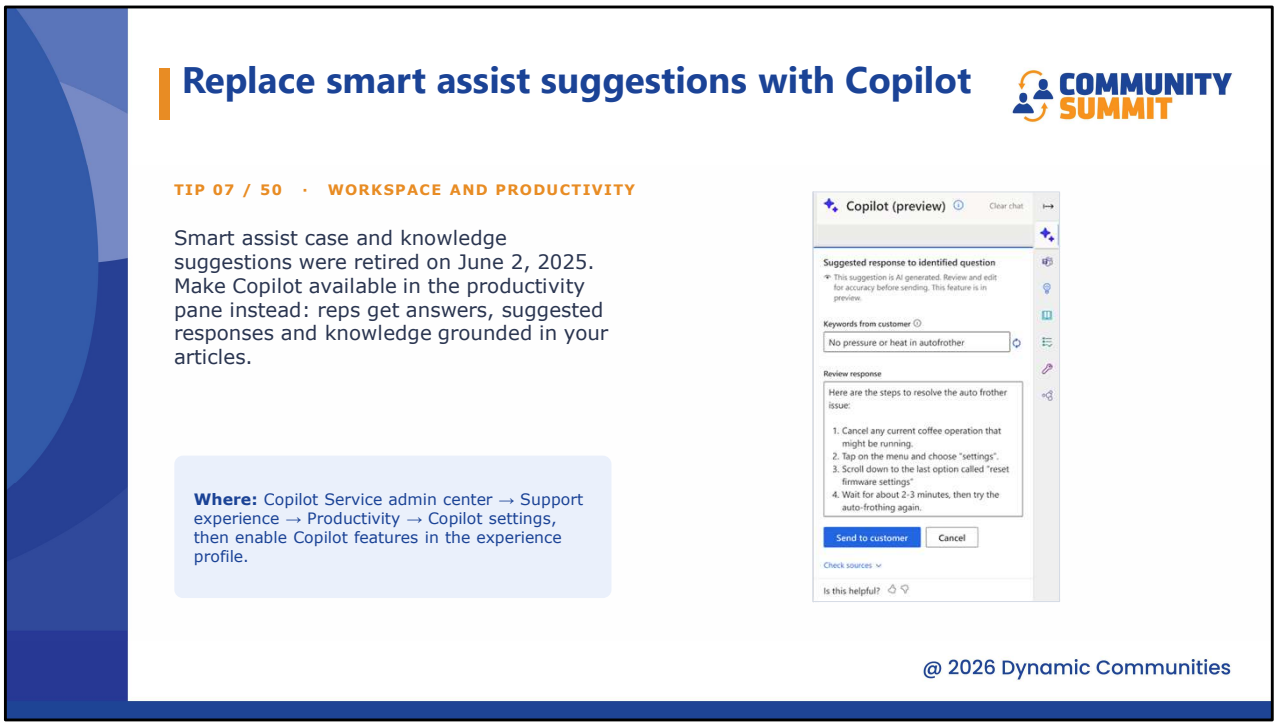

Note: In the out-of-box workspace app, create a custom profile first to enable scripts.

@ 2026 Dynamic Communities

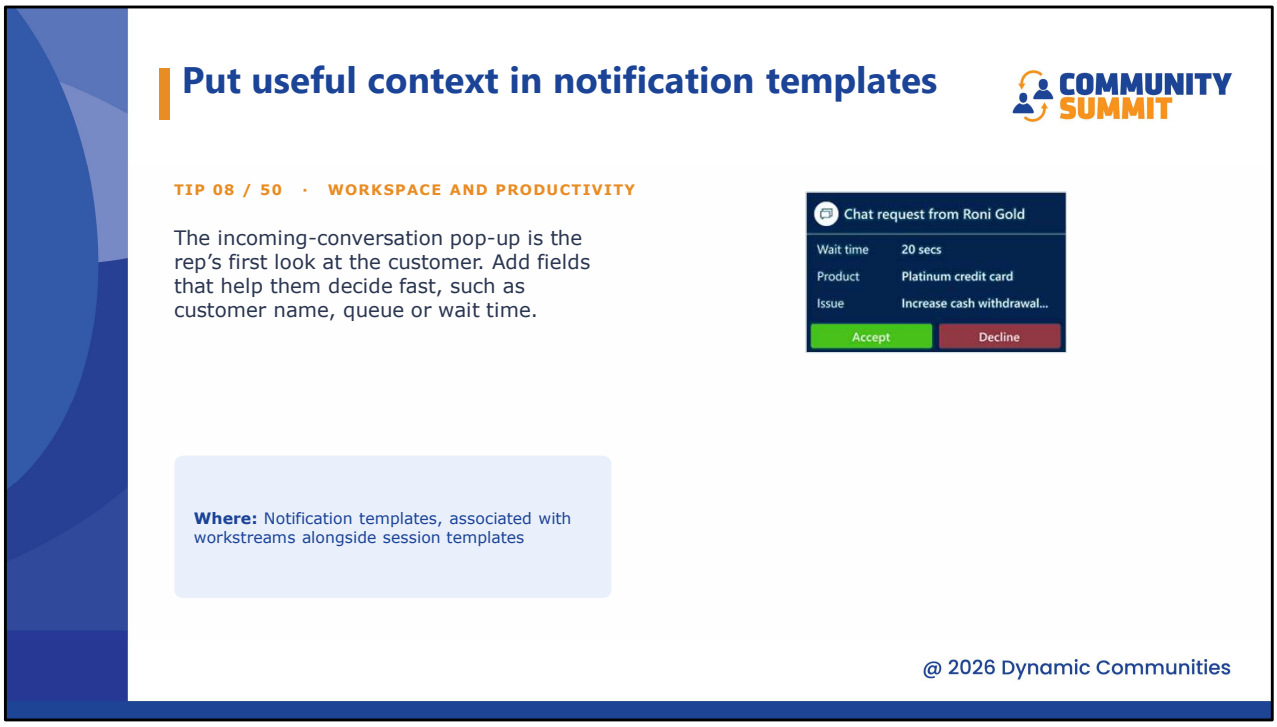

Scripts are step-by-step guidance in the productivity pane: text instructions, macros to run, or links to other scripts. They shine for compliance-heavy moments like identity verification and required disclosures, and for new reps who don't yet know the flow. The trick most people miss is the default: on the session template you can use a build expression to choose which script loads based on context, like the issue type you see in the dropdown here. One gotcha: in the out-of-box workspace app you need a custom experience profile before scripts can be enabled.

Source: Scripts in the Copilot Service workspace app — https://learn.microsoft.com/dynamics365/customer-service/use/oc-agent-scripts

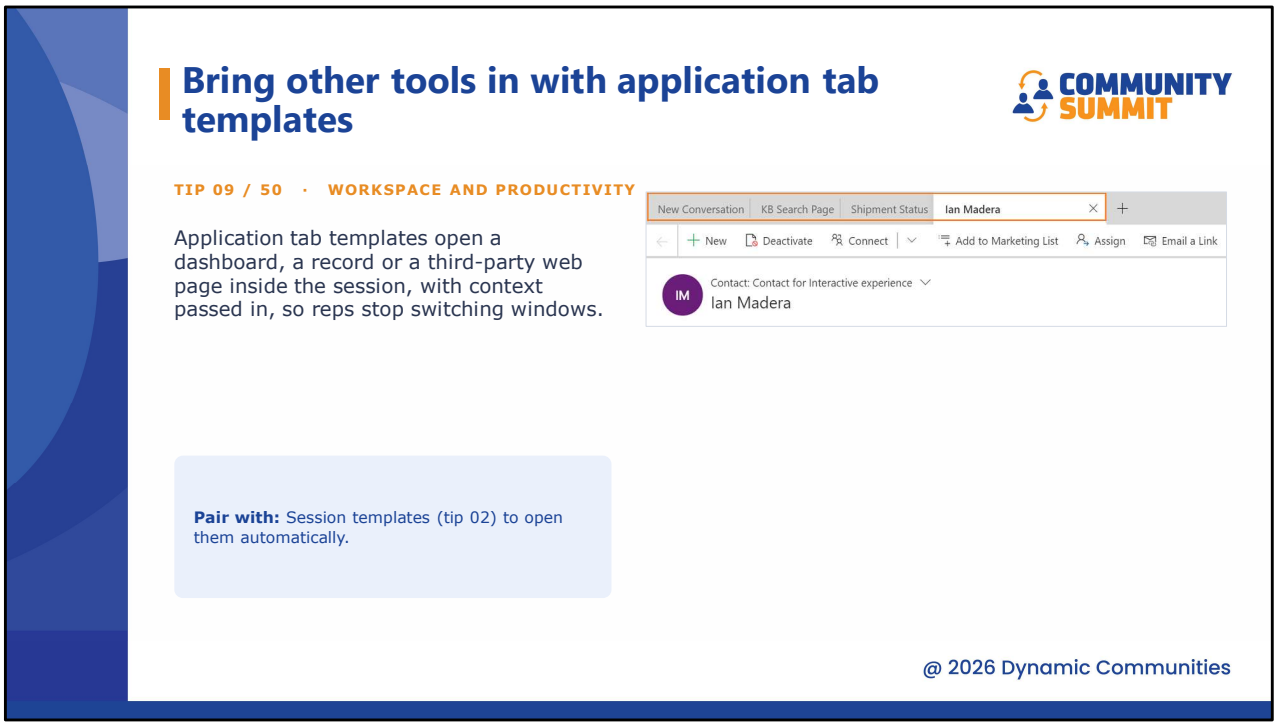

Updated tip. The original version of this slide was about smart assist suggesting similar cases and articles. Microsoft deprecated case and knowledge suggestions in smart assist as of June 2, 2025 and recommends making Copilot available to reps instead. So if anyone still has smart assist in their profiles, this is the replacement path. Turn on the Copilot side pane under Productivity, Copilot settings, then make sure the features are enabled in the experience profile. Out-of-box profiles have Copilot on by default; custom profiles need it switched on. Knowledge search, scripts and macros stay in the same pane.

Source: Manage Copilot features in Customer Service — https://learn.microsoft.com/dynamics365/customer-service/administer/configure-copilot-features

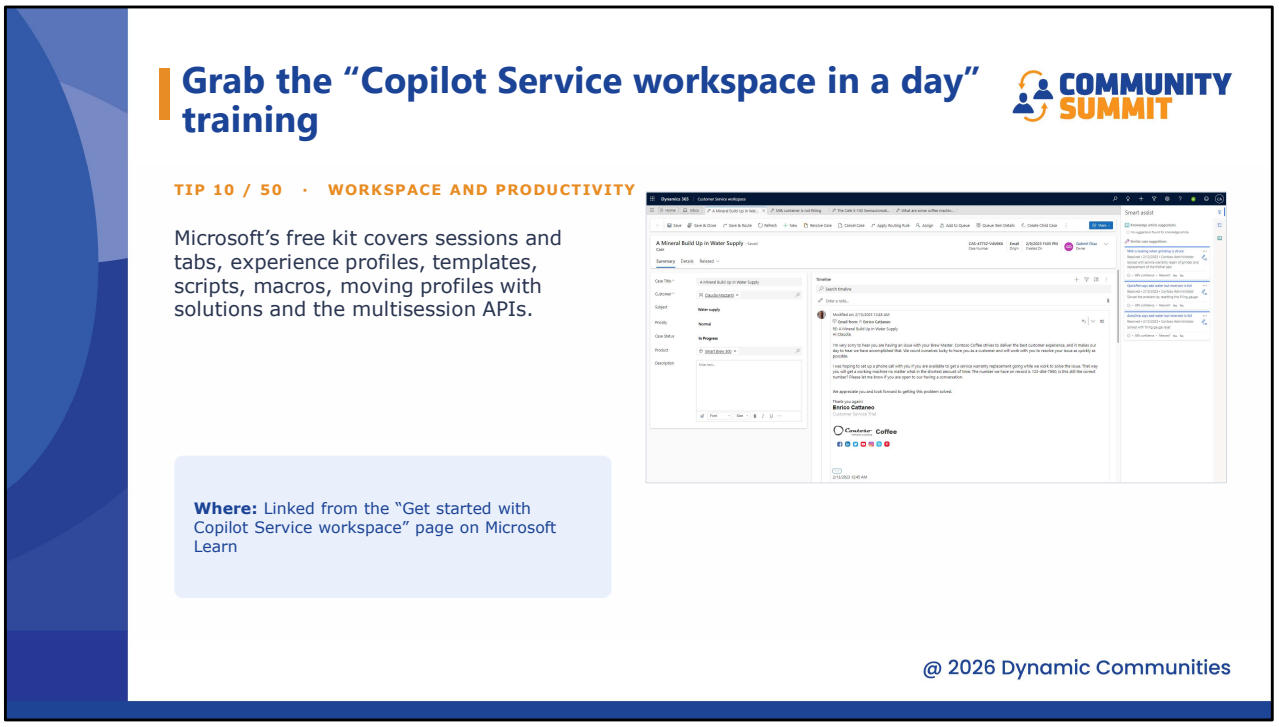

The notification toast is the rep's first impression of the customer and they only see it for a few seconds. Out of the box it's fairly bare. Here you can see a better example: wait time, the product and the issue right on the pop-up, so the rep can start the conversation already knowing the context. Notification templates sit alongside session templates on the workstream, so you can tailor them per channel. You can also set timeouts and whether the rep can reject. Small change, but reps notice it immediately and it speeds up acceptance.

Source: Manage notification settings and templates — https://learn.microsoft.com/dynamics365/customer-service/administer/notification-templates

Every alt-tab to another system costs time and context. Application tab templates let you open those other tools inside the session as tabs: a dashboard, an entity record, a search page or a third-party website. You can pass context in through parameters, for example opening an order-lookup page with the customer's account number already in the URL. On screen you can see a session with a KB search page and a shipment status tab sitting next to the contact. Add the template to your session template from tip two and it opens automatically.

Source: Manage application tab templates — https://learn.microsoft.com/dynamics365/customer-service/administer/application-tab-templates

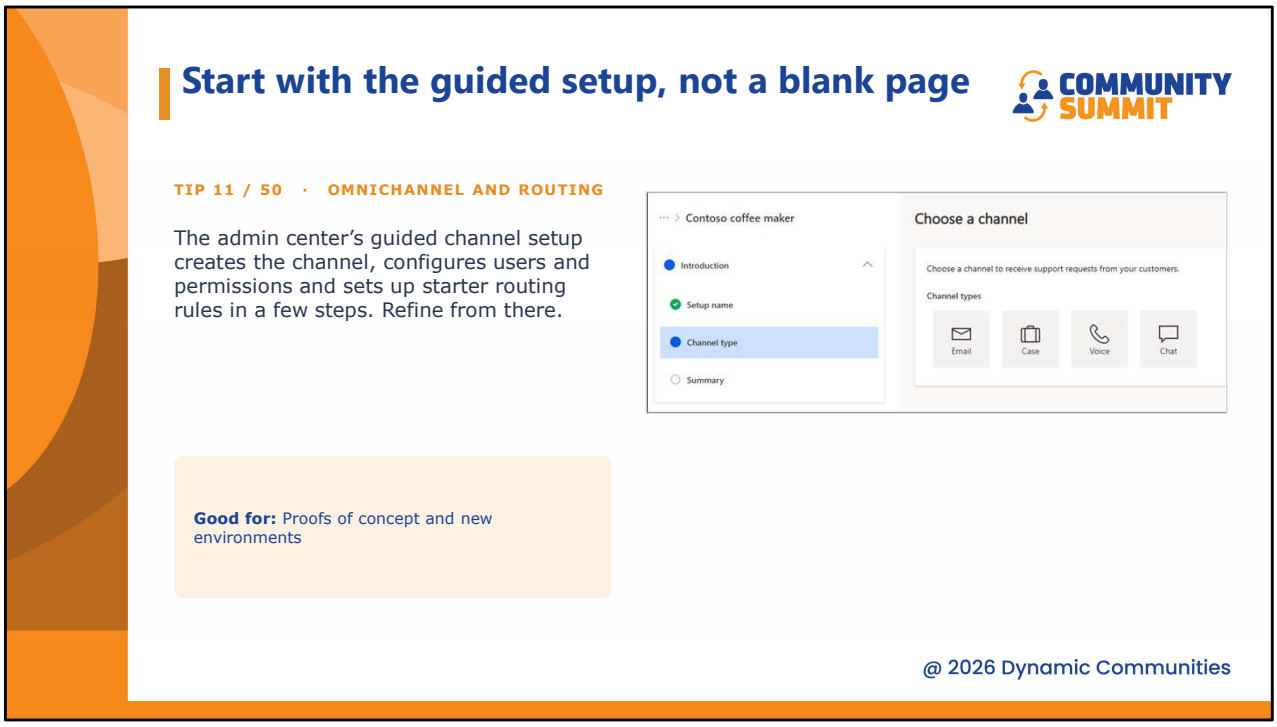

Last tip in this block, and it's a resource rather than a setting. Microsoft publishes a free in-a-day training kit for Copilot Service workspace that walks through everything we've just covered hands-on: sessions and tabs, experience profiles, session and notification templates, scripts, macros, moving profiles with solutions and the multisession APIs. It's a good way to get a new admin or a partner up to speed. It's linked from the Get started page on Learn. If anyone is still on Unified Service Desk, the same page links the migration guidance, and USD was deprecated in April 2026.

Source: Get started with Copilot Service workspace — https://learn.microsoft.com/dynamics365/customer-service/implement/csw-overview

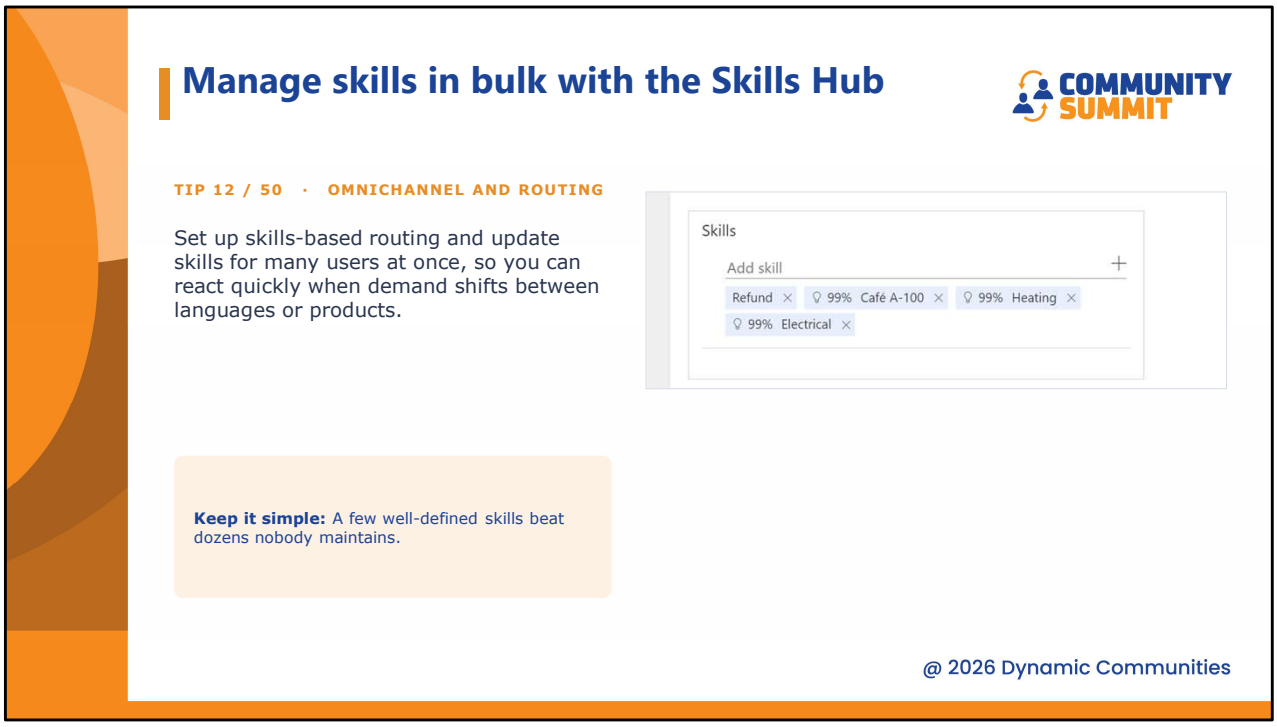

Block two is how work gets to the right person: setup, skills, intent, transfers, queue experience for customers, callbacks and outbound. A lot of what's here went generally available during 2026, so if you set up routing a couple of years ago it's worth a fresh look. We'll finish the block with deprecations, because two of them land this month and next.

If you're standing up a new environment or a proof of concept, don't start by building queues and rulesets by hand. Copilot Service admin center has a guided channel setup wizard that creates the channel, sets up users and permissions, and adds starter routing rules, so you have something working end to end in minutes. For brand-new organizations there's also a Create your contact center option that sets up chat, voice, a default experience profile and recommended AI features in one click. Get it working, show it, then tune queues and rules afterwards.

Source: Get started with Copilot Service admin center — https://learn.microsoft.com/dynamics365/customer-service/implement/cs-admin-center

Skills-based routing is powerful, but it falls apart when skills aren't maintained. The Skills Hub lets you set up skills and update them for many representatives at once instead of opening each user record. That matters when demand shifts, for example when you need more Spanish coverage for a launch week. My advice is to keep the skill model small and meaningful: a handful of well-defined skills beats dozens nobody keeps current. Before go-live, agree with operations on proficiency levels and whether you use exact match or closest match.

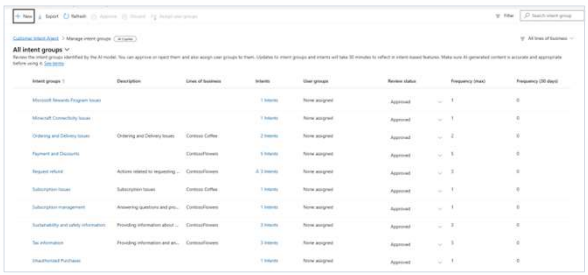

Source: Set up skills and assign representatives — https://learn.microsoft.com/dynamics365/customer-service/administer/setup-skills-assign-agents

Route on what the customer actually wants

COMMUNITY SUMMIT

TIP 13 / 50 · OMNICHANNEL AND ROUTING

Intent-driven routing captures the customer's intent from the incoming conversation and maps it to the representatives best placed to help.

Pairs with: Customer Intent Agent (tip 39), which discovers and suggests intents for you

@ 2026 Dynamic Communities

Traditional routing depends on the customer picking the right option from a pre-chat menu or IVR tree, and they often don't. Intent-driven routing captures intent from what the customer actually says in the conversation, then maps that intent to the representatives best placed to help. The intents themselves are organized into intent groups like the list on screen, and the Customer Intent Agent, which we'll cover in tip 39, can discover and suggest them from your real conversations. Result: shorter menus, fewer misroutes and fewer transfers.

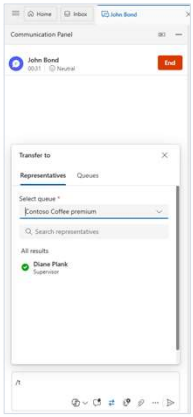

Source: Manage Customer Intent Agent — https://learn.microsoft.com/dynamics365/contact-center/administer/manage-customer-intent-agent

Transfer by intent, not by guesswork

COMMUNITY SUMMIT

TIP 14 / 50 · OMNICHANNEL AND ROUTING

Reps can use intent to pick the right workgroup, queue or individual representative when they transfer, instead of hunting through queue names.

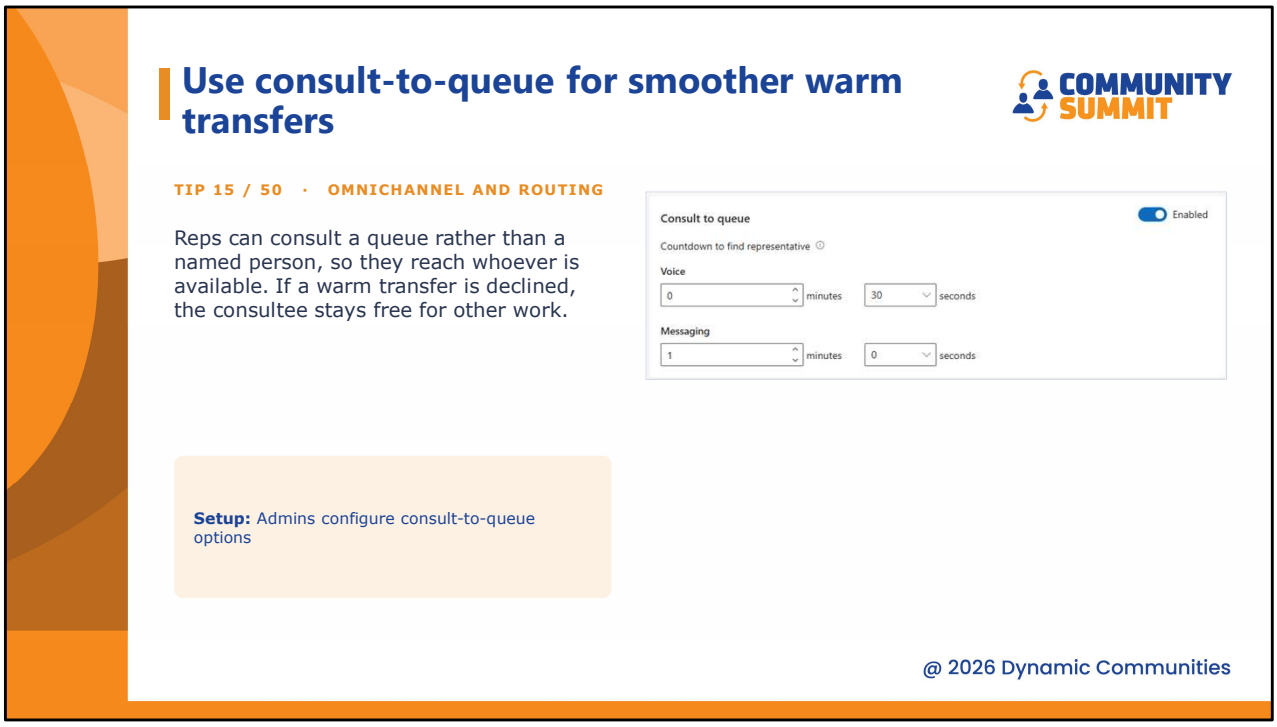

Availability: Generally available since January 2026 (Contact Center)

@ 2026 Dynamic Communities

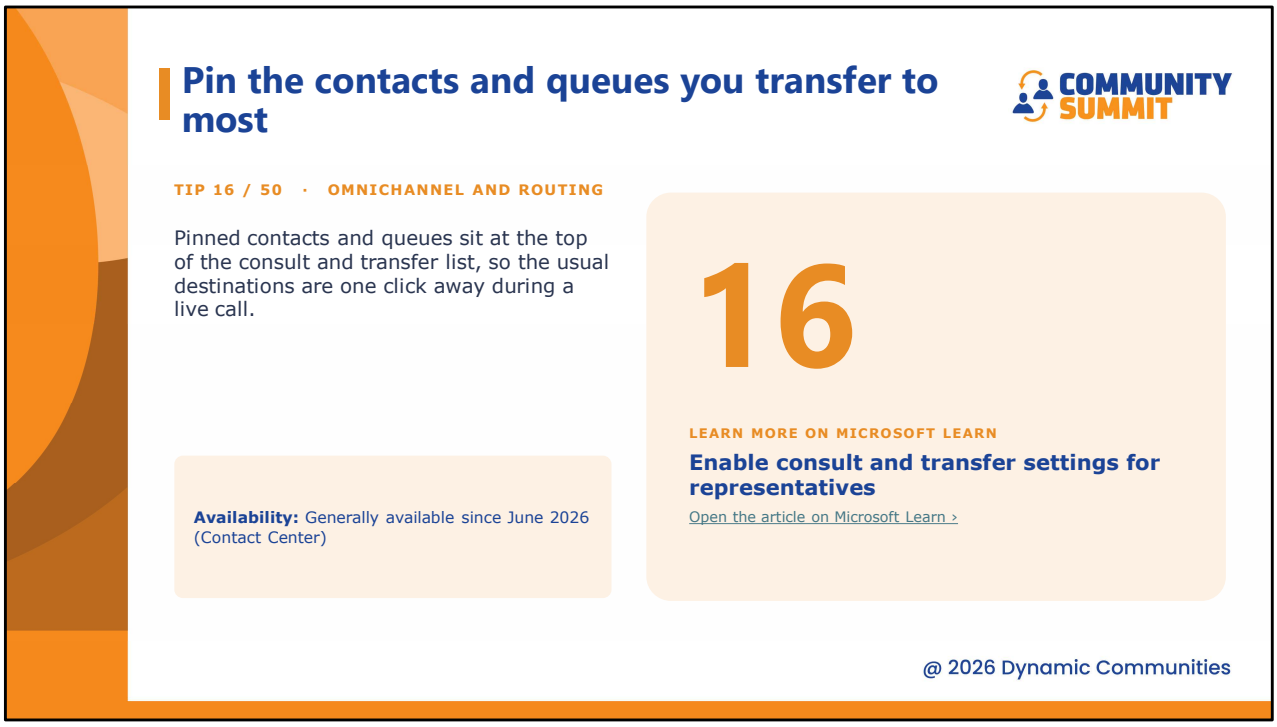

Same idea applied to transfers. When a rep needs to hand off, they usually scroll through a list of queue names and guess. With intent-based transfer, the rep can use the conversation's intent to pick the right workgroup, queue or individual representative. You can see the transfer pane here with the representatives and queues tabs. This went GA in January 2026 for Contact Center. The benefit customers feel is fewer bounced transfers and not having to explain their problem three times.

Source: View the communication panel for conversations — https://learn.microsoft.com/dynamics365/customer-service/use/oc-conversation-control

Warm transfers often fail because the rep is trying to reach one specific person who's busy. Consult-to-queue lets the rep consult a queue instead, and the system finds whoever is available. On screen is the admin setting: you turn on consult to queue and set the countdown for how long the system looks for a representative, separately for voice and messaging. Another detail from the late-2025 updates: if a warm transfer is declined, the consulted representative stays free for other work instead of being tied up.

Source: Enable consult and transfer settings for representatives — https://learn.microsoft.com/dynamics365/customer-service/administer/enable-transfer-consult

Small quality-of-life feature that reps notice immediately. Most reps transfer to the same three or four places: tier two, billing, a supervisor. Pinning puts those contacts and queues at the top of the consult and transfer list, so during a live call the usual destination is one click away instead of a search. Generally available since June 2026 in Contact Center. Worth a mention in your next rep newsletter because it's the kind of thing people don't discover on their own.

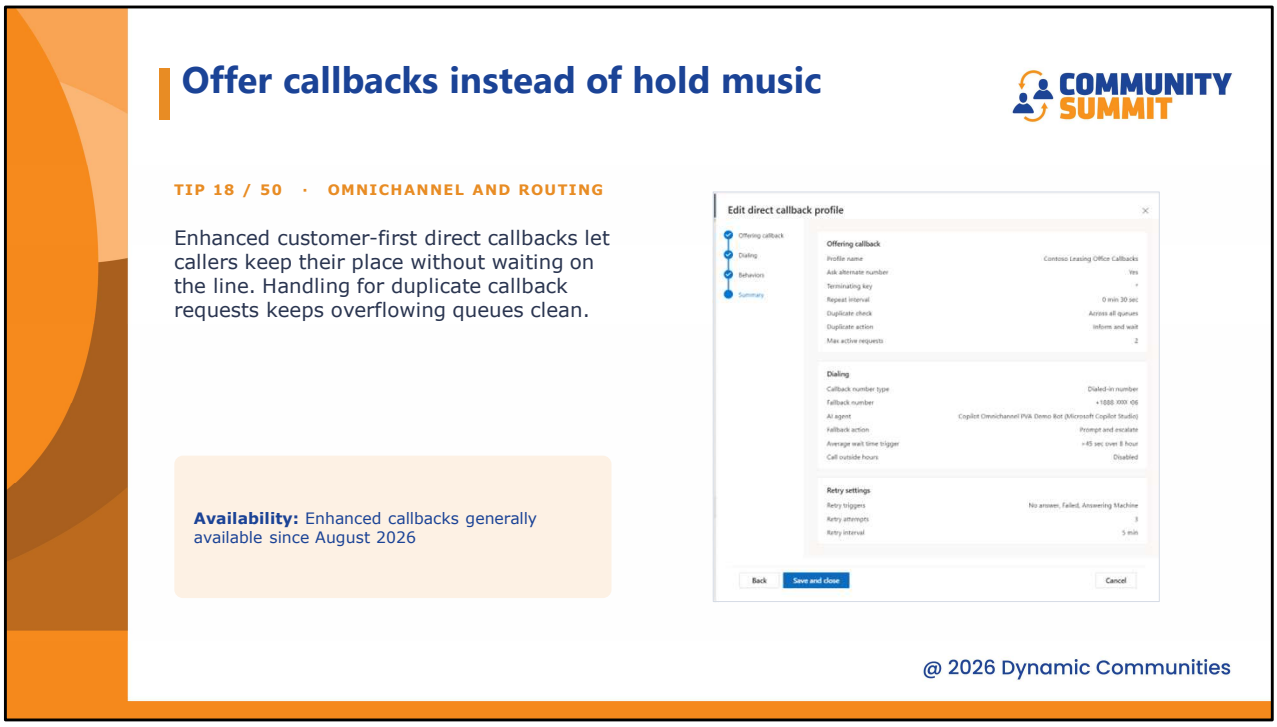

Source: Enable consult and transfer settings for representatives — https://learn.microsoft.com/dynamics365/customer-service/administer/enable-transfer-consult

Live Demo

Customers will wait a surprisingly long time if they know what's happening, and they abandon quickly when they don't. You can show chat customers their position in the queue and the average wait time, and send an automatic message when waits go past a threshold you choose, something like wait times are longer than expected. In June 2026 average wait time support was extended to messaging API channels too. This is a low-effort change that directly reduces abandonment, so it's a good one to measure before and after.

Source: Show customers their average wait time in a queue — https://learn.microsoft.com/dynamics365/customer-service/administer/average-wait-time

Nobody enjoys hold music. Customer-first direct callback lets a caller keep their place in the queue and get called back instead of waiting on the line. What you see here is the callback profile: you set what's offered, the dialing behavior, and how duplicate requests are handled so a customer who asks three times doesn't get three callbacks. You attach the profile to an overflow action on the queue. The enhanced version went GA in August 2026, and recent updates also validate phone numbers before automated callbacks fire.

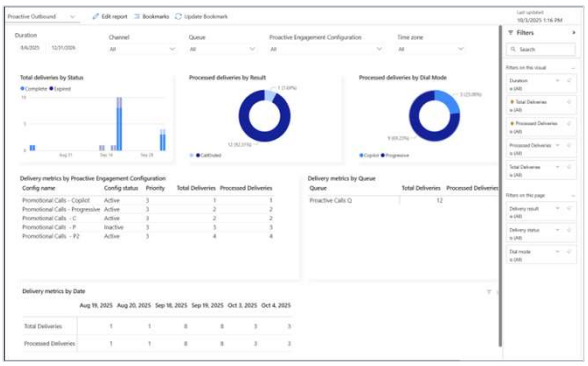

Source: Configure customer-first direct callback — https://learn.microsoft.com/dynamics365/contact-center/administer/configure-customer-first-callback

Reach out first with proactive engagement

COMMUNITY SUMMIT

TIP 19 / 50 · OMNICHANNEL AND ROUTING

Run voice outbound campaigns, use preview dial for high-value calls, and send proactive SMS. Then review engagement outcomes to see what worked.

Availability: Outbound campaigns and preview dial GA March 2026; proactive SMS GA April 2026

@ 2026 Dynamic Communities

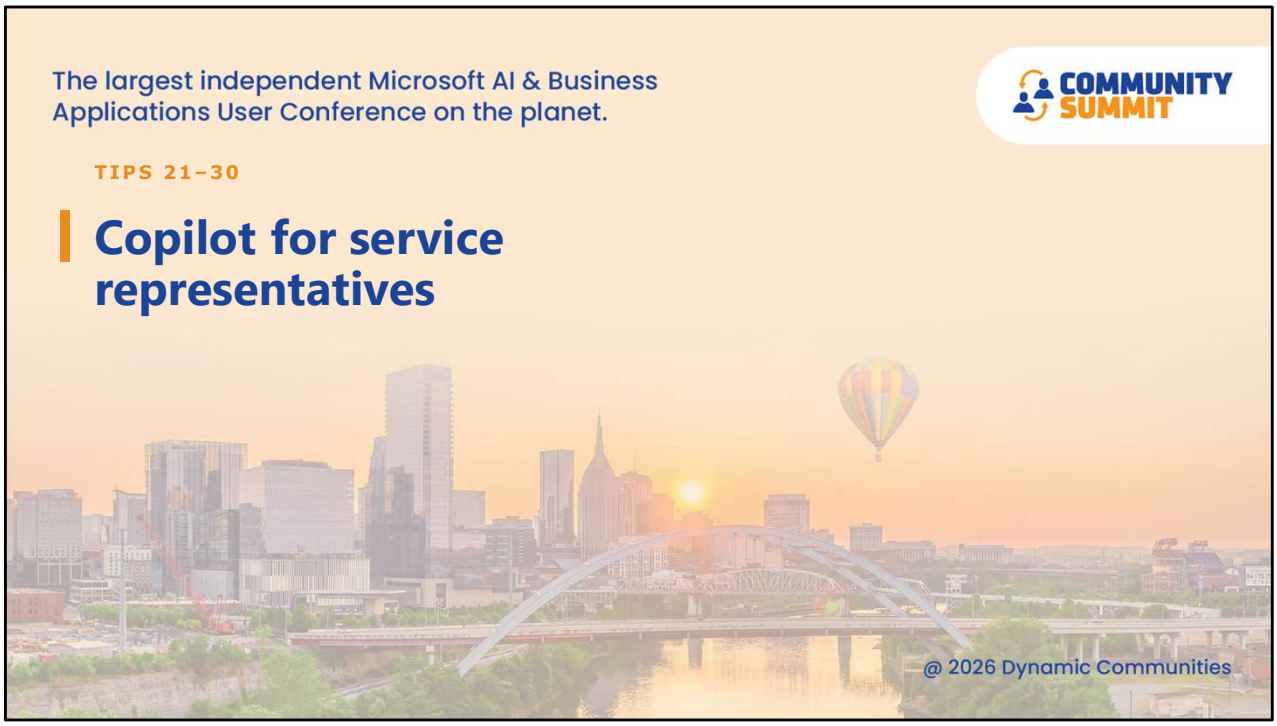

Service doesn't have to wait for the customer to call. Proactive engagement lets you run voice outbound campaigns, use preview dial when you want the rep to see the record before the call connects, and send proactive SMS. Think appointment reminders, outage notices, renewal calls. Outbound campaigns and preview dial went GA in March 2026 and proactive SMS in April. Then close the loop with the Proactive Outbound dashboard on screen, which breaks down deliveries by status, result and dial mode so you can see what actually worked.

Source: Proactive Outbound dashboard — https://learn.microsoft.com/dynamics365/contact-center/use/proactive-outbound-dashboard

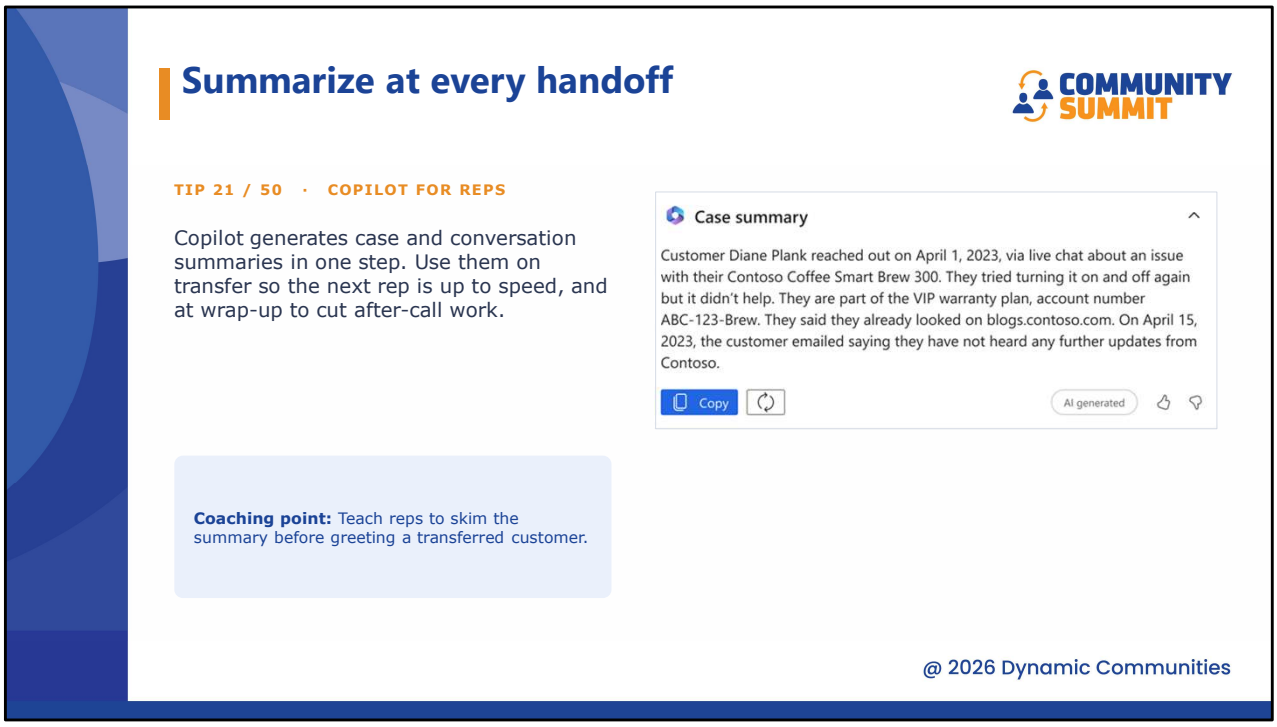

Last tip in this block, and it's timely. Two deprecations to call out. Apple Messages for Business onboarding was deprecated in July and the configuration options were removed from the admin center on September 30. And forecasting for case and conversation volumes in Contact Center ends on October 30, 2026, a couple of weeks from now. The replacement is forecast scenarios in workforce engagement management, which adds capacity planning and scheduling. Quick show of hands: who is still using the old forecasting? Bookmark the deprecations page and check it every release.

Source: Deprecations in Dynamics 365 Contact Center — https://learn.microsoft.com/dynamics365/contact-center/implement/deprecations-contact-center

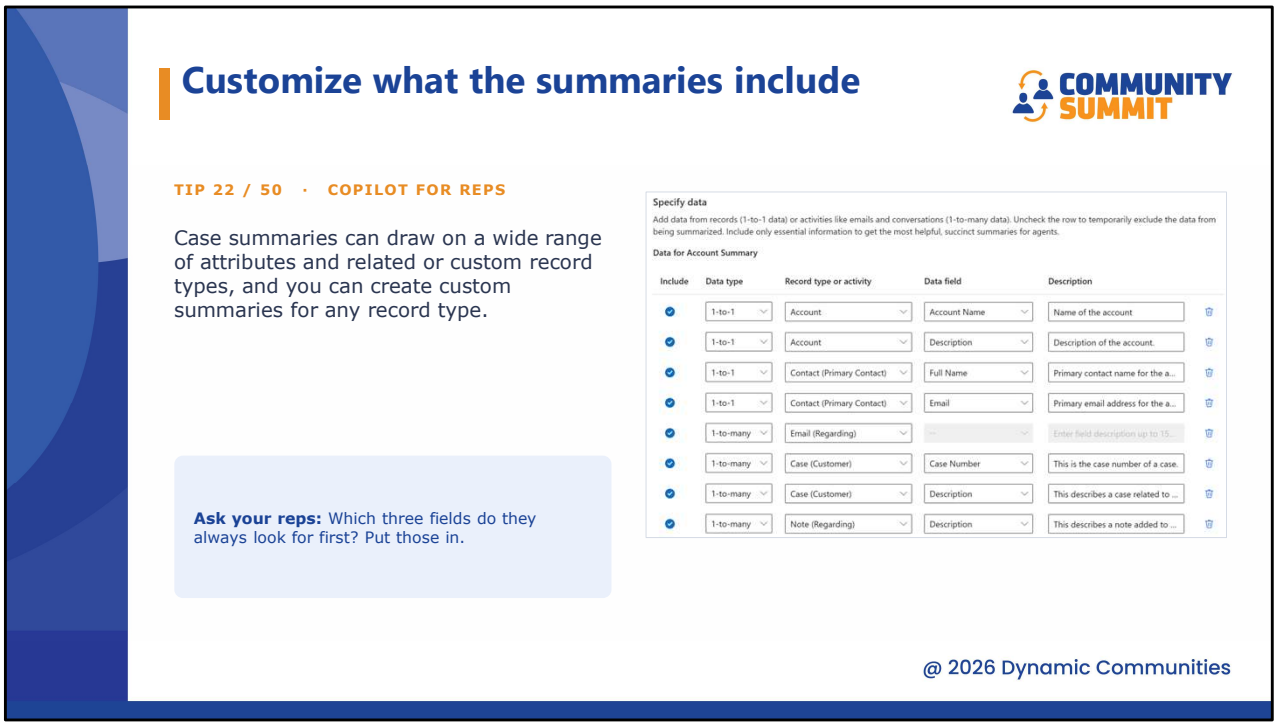

Block three is Copilot in the hands of the rep: summaries, grounded answers, email drafts, Service Agent, sentiment, translation and measuring whether any of it helps. The common thread is that Copilot is only as good as the data and knowledge you point it at, so several of these tips are really about curation rather than switching things on.

Summaries are the simplest Copilot win and the easiest to measure. Copilot generates a case or conversation summary in one step, like the example on screen. Use them in two places: on transfer, so the next rep is up to speed before they say hello, and at wrap-up, to cut after-call work. The coaching point is behavioral: teach reps to read the summary before they greet a transferred customer. The phrase we want to eliminate is: can you tell me again what the issue is?

Source: Use Copilot-generated case summaries — https://learn.microsoft.com/dynamics365/customer-service/use/copilot-use-summary

Out-of-the-box summaries are generic. The value shows up when you tailor them. You can choose which attributes go into case summaries, including related and custom record types, and you can create custom summaries for other records such as accounts, as on screen, where you pick the one-to-one and one-to-many data to include. A simple way to decide: ask your reps which three fields they always look for first, and make sure those are in. Then check a handful of summaries with real cases before rolling it out.

Source: Configure custom record summaries — https://learn.microsoft.com/dynamics365/customer-service/administer/copilot-enable-custom-record-summaries

Ground “Ask a question” in sources you trust

COMMUNITY SUMMIT

TIP 23 / 50 · COPILOT FOR REPS

Copilot answers from your knowledge base and trusted domains you choose. Curate those sources carefully: answer quality depends on them.

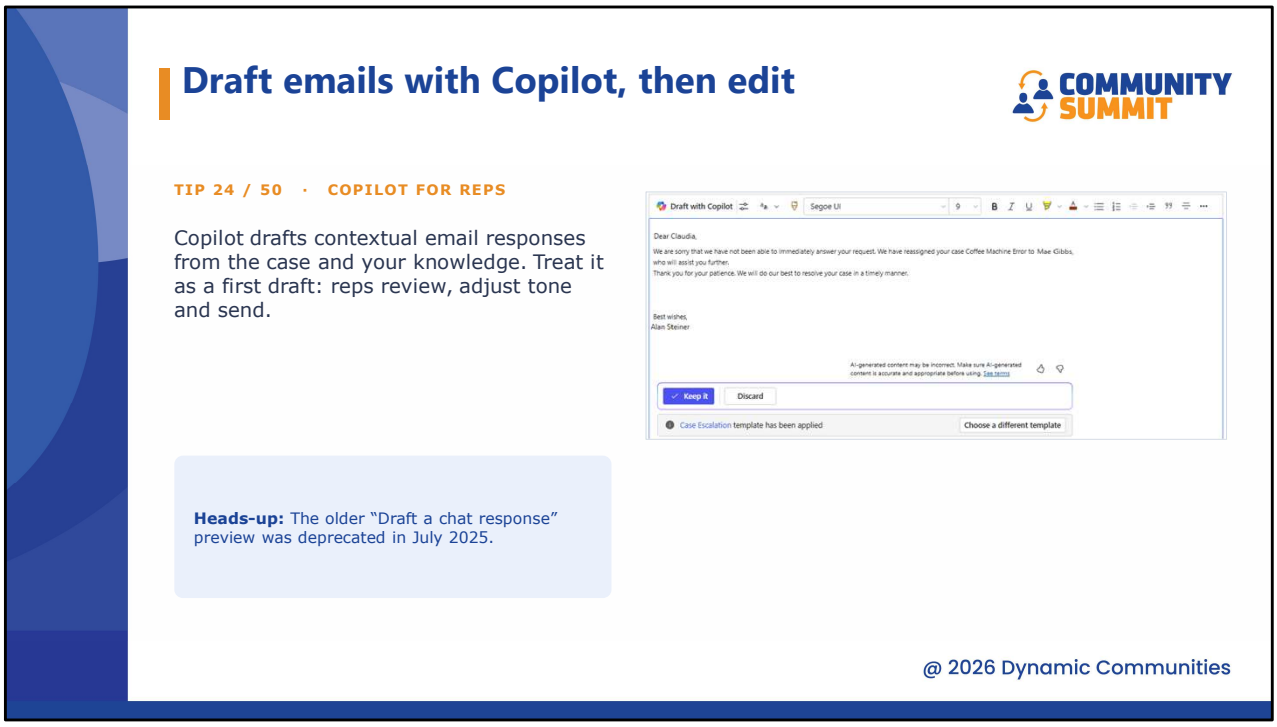

Quick win: Retire outdated knowledge articles before you switch it on.

@ 2026 Dynamic Communities

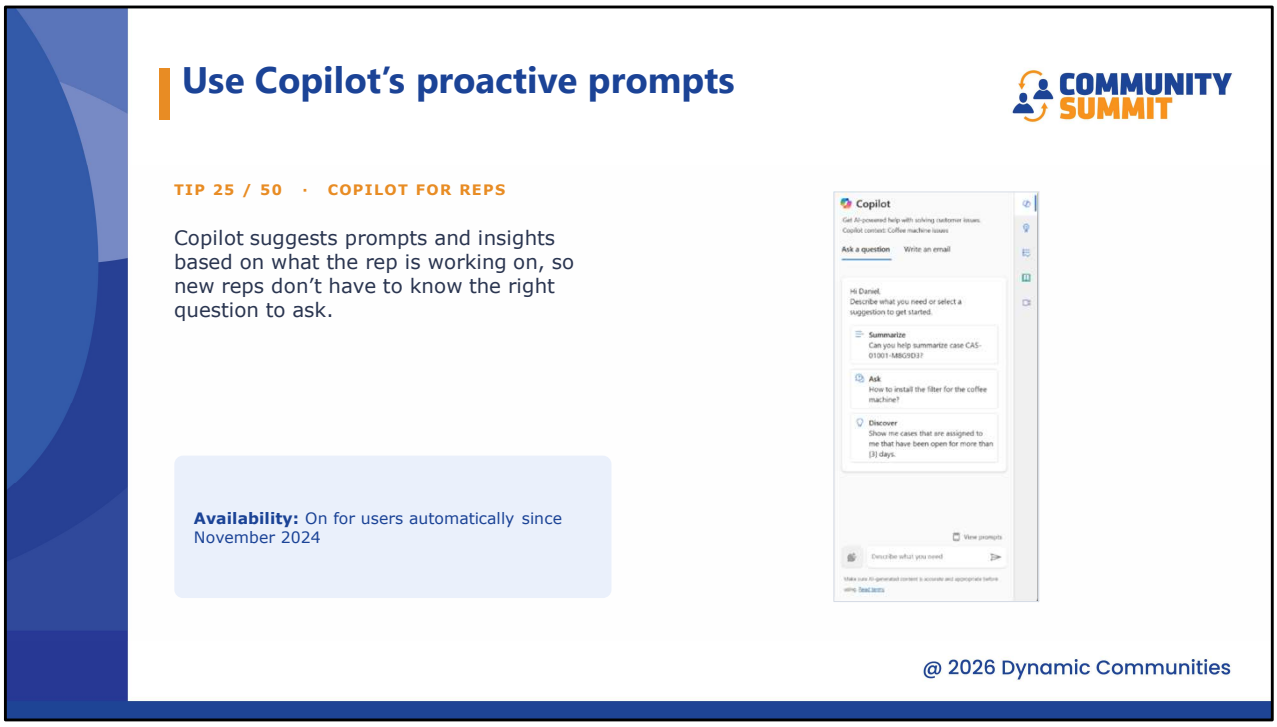

Ask a question lets reps type a question in plain language and get an answer grounded in your knowledge base and any trusted web domains you choose. On screen you can see an answer with the steps pulled from an article and a link to the source. The catch is that garbage in, garbage out still applies to generative AI. If your knowledge base has three conflicting versions of the returns policy, Copilot will find them. The quick win is to retire outdated articles before you switch this on, and to be conservative about external domains.

Source: Manage Copilot features in Customer Service — https://learn.microsoft.com/dynamics365/contact-center/administer/configure-copilot-features

Copilot can draft email responses using the case context and your knowledge articles, right in the email editor as you see here, with Keep it or Discard. Reps can pick a type of email, like suggest a call or request more information, and adjust tone. Treat it as a first draft: the rep reviews, edits and sends. Line-of-business email templates help Copilot and the Case Management Agent pick the right format. One heads-up: the older Draft a chat response preview was deprecated in July 2025, so don't plan around that one.

Source: Draft emails with Copilot — https://learn.microsoft.com/dynamics365/contact-center/use/use-copilot-email

Many reps open the Copilot pane and don't know what to ask. Proactive prompts solve that: Copilot suggests prompts and insights based on what the rep is working on, like summarize this case, or how to install the part the customer mentioned, as you can see on screen. It's been on for users automatically since November 2024, which means a lot of your reps already have it and have never noticed it. Point it out explicitly in onboarding; it's the easiest way to get new reps using Copilot.

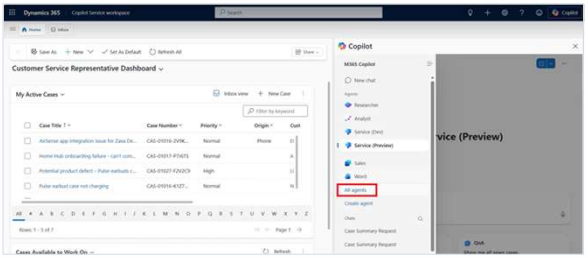

Source: Manage Copilot features in Customer Service — https://learn.microsoft.com/dynamics365/contact-center/administer/configure-copilot-features

Let reps do tasks in plain language with Service Agent

COMMUNITY SUMMIT

TIP 26 / 50 · COPILOT FOR REPS

Service Agent works in Copilot Service workspace to look things up, summarize, draft communications, update cases and create notes without leaving the conversation.

Setup: The Service app installs automatically with a Customer Service license; an admin then adds Microsoft Copilot to the environment.

@ 2026 Dynamic Communities

Checked against the current docs. Service Agent is the agent that sits in the Copilot pane in Copilot Service workspace and is selected automatically there. Reps use plain language to look up information, summarize cases and accounts, draft communications, update cases, create notes and activities, without leaving the conversation. It can also produce charts and Word, Excel or PowerPoint files from service data. Setup has two separate parts: the Service app, which installs automatically when a Customer Service license is assigned, and a Dynamics 365 admin adding Microsoft Copilot to the environment for the in-app experience.

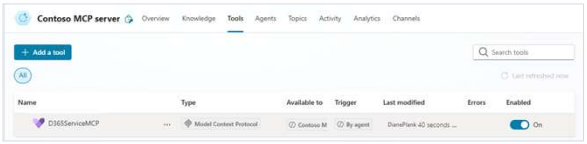

Source: Overview of Service Agent — https://learn.microsoft.com/dynamics365/customer-service/use/service-agent-overview

Use Service Agent from Microsoft 365 Copilot too

COMMUNITY SUMMIT

TIP 27 / 50 · COPILOT FOR REPS

Service Agent is also a Microsoft 365 Copilot agent, grounded in both Dataverse and Microsoft Graph. People outside the workspace can check and update service data from Teams or Outlook.

Extend it: Add your own tools via custom MCP (Model Context Protocol) servers

@ 2026 Dynamic Communities

Service Agent isn't only in the service app. It's also a Microsoft 365 Copilot agent, grounded in both Dataverse and Microsoft Graph, so it can combine service records with email, meetings and files. That's great for account managers and subject-matter experts who don't live in the service app: they can check and update service data from Teams or Outlook, and in Outlook it can use the open email thread as context. You can extend it with your own tools through custom MCP servers; on screen is an MCP server added as a tool in Copilot Studio.

Source: Configure non-Microsoft MCP servers in Service Agent — https://learn.microsoft.com/dynamics365/customer-service/administer/configure-service-agent-mcp-servers

Sentiment has been available on live conversations for a while. Case sentiment brings it onto the case form, so a rep opening a case can see that the customer is frustrated before reading the whole timeline, and adjust tone or escalate early. It arrived in 2026 release wave 1 and admins enable it. The Learn page still labels it preview, so check your environment for current status before you demo it, and agree with supervisors what a negative indicator should trigger.

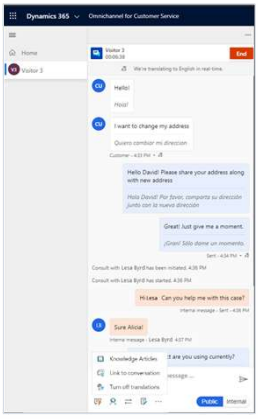

Source: Configure sentiment analysis for case — https://learn.microsoft.com/dynamics365/customer-service/administer/configure-case-sentiment-analysis

Serve more languages with real-time translation

COMMUNITY SUMMIT

TIP 29 / 50 · COPILOT FOR REPS

Real-time translation lets a rep chat with a customer in a language they don't speak. Recent updates made translation faster and more consistent.

Availability: Enhanced real-time translation entered preview September 2026

@ 2026 Dynamic Communities

Real-time translation lets a rep chat with a customer in a language they don't speak: the rep reads and types in their language, the customer reads and types in theirs, and you can see both versions in the conversation on screen. Enhanced translation, which is faster and more consistent, entered preview in September 2026. The operational use case I like is overflow: you can route a rare-language chat to any available rep instead of waiting for the one person who speaks it. Check which languages are supported before you promise coverage.

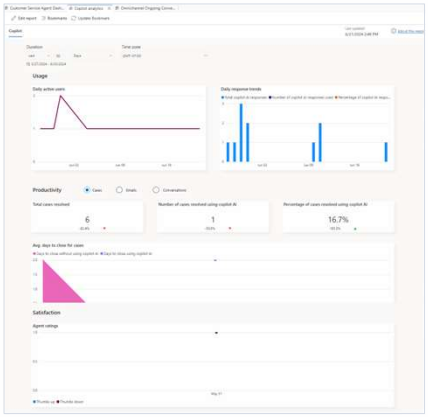

Source: Use real-time translation of conversations — https://learn.microsoft.com/dynamics365/customer-service/use/oc-real-time-translation

Record how reps use AI, and their feedback

COMMUNITY SUMMIT

TIP 30 / 50 · COPILOT FOR REPS

Turn on recording of rep interactions with AI, including their thumbs up or down on suggestions. Download the data to see what helps and where knowledge is thin.

Why: It turns "is Copilot worth it?" into a question you can answer with data.

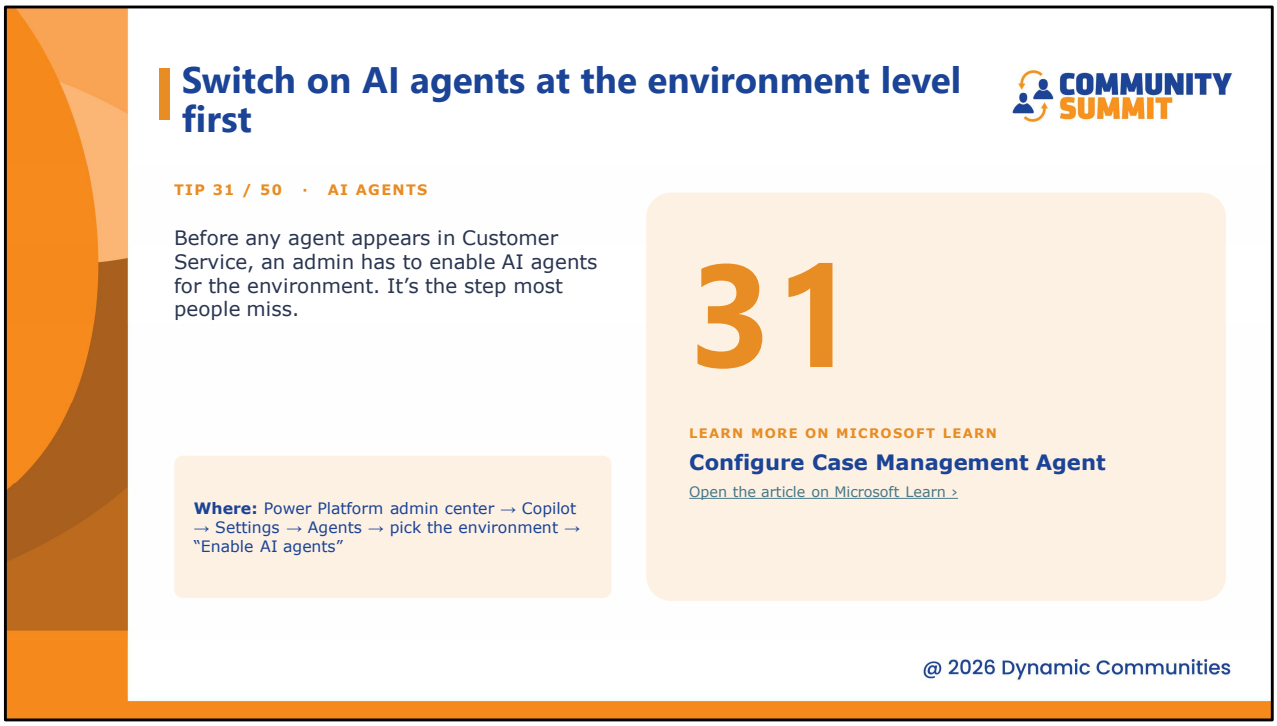

@ 2026 Dynamic Communities

Final Copilot tip, and it's the one that answers the budget question. Turn on recording of rep interactions with AI, including thumbs up and thumbs down on suggestions. The setting lives under representative experience data. You then get Copilot analytics like the dashboard on screen, and you can download the transcripts and interaction data for deeper analysis. Two things come out of it: which features reps actually use, and where answers are poor, which usually means a gap in your knowledge base. It turns is Copilot worth it into a question you can answer with data.

Source: Manage analytics for Copilot — https://learn.microsoft.com/dynamics365/customer-service/administer/copilot-analytics

Block four moves from assistance to autonomy: agents that create, update, resolve, follow up and close cases, plus the knowledge and intent agents behind them. The theme to hold onto is earn trust in steps: environment switch first, then semi-autonomous, shadow mode, small rules, and only then full autonomy.

Before anything else in this block works, an admin has to enable AI agents for the environment in Power Platform admin center: Copilot, Settings, Agents under Dynamics 365 Customer Service, pick the environment, Edit setting, and tick Enable AI agents. It's the step most people miss, and the symptom is that the agent pages in the admin center are greyed out. While you're there, check the other prerequisites: move data across regions for generative AI, and pay-as-you-go billing, because these agents consume Copilot Studio capacity when they run.

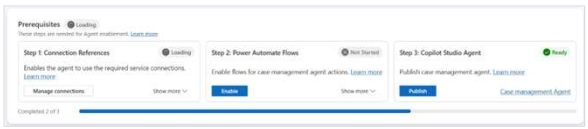

Source: Configure Case Management Agent — https://learn.microsoft.com/dynamics365/customer-service/administer/case-management-global-settings

Let the Case Management Agent fill in case forms

COMMUNITY SUMMIT

TIP 32 / 50 · AI AGENTS

The agent creates and updates cases from chats, voice and email, predicting the fields you choose. It only fills a field when the conversation gives it enough context.

Where: Customer support → Case settings → Case Management Agent → Manage

@ 2026 Dynamic Communities

The Case Management Agent creates and updates cases from chats, voice calls and email, predicting the fields you choose. Importantly, it only fills a field when the conversation gives it enough context, so it won't guess a product if the customer never mentioned one. On screen is the Case Management Agent page with its prerequisites: connection references, Power Automate flows and the Copilot Studio agent. Reps can also get AI form-fill assistance when they create a case manually, and they review before saving. Tip: improve field descriptions in Power Apps, because the agent uses them.

Source: Set up Case Management Agent for case creation and update — https://learn.microsoft.com/dynamics365/customer-service/administer/set-up-autonomous-case-agents

Beyond the default fields, case update rules tell the agent which extra fields to predict when a condition is met. The example straight from Microsoft's docs: when Case category equals Product defect, also predict Product, Priority and Serial number. That's easy to demo and easy to explain to the business. Start with one or two rules for your highest-volume case types, check the results, then add more. Rules that try to cover every case type at once are hard to test and hard to trust.

Source: Set up Case Management Agent for case creation and update — https://learn.microsoft.com/dynamics365/customer-service/administer/set-up-autonomous-case-agents

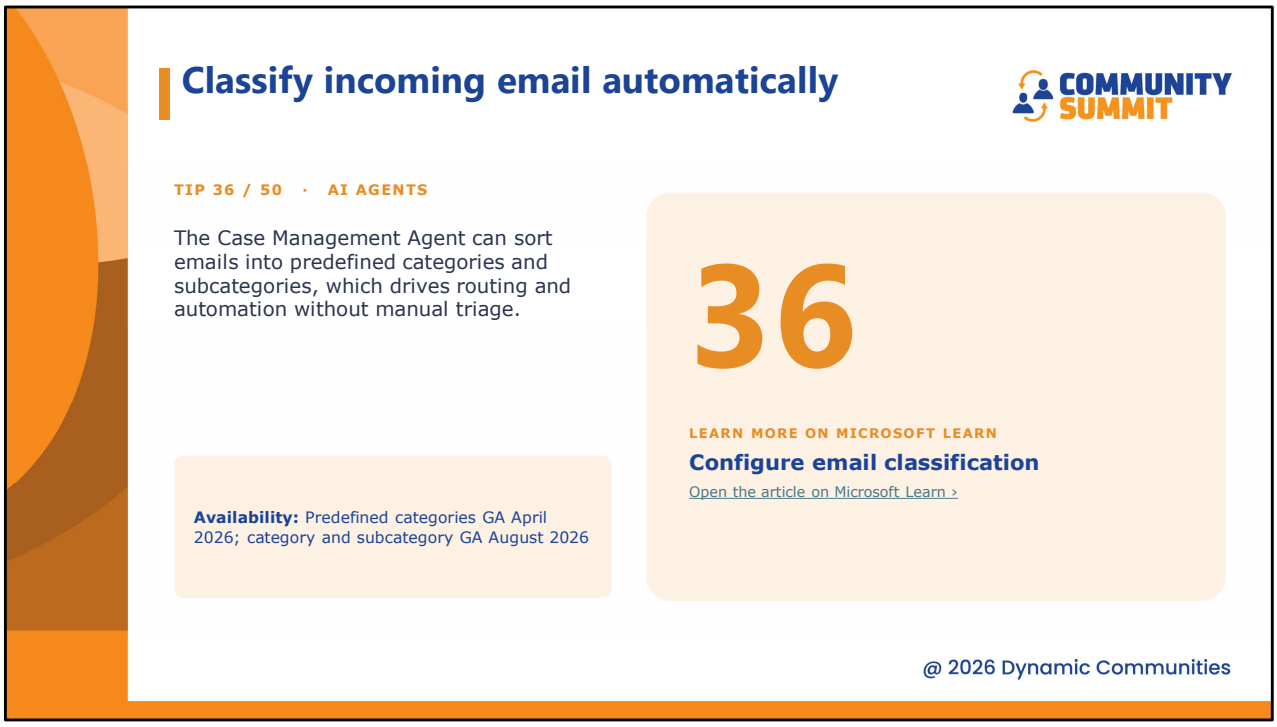

For resolution and for follow-up and closure, the agent has two modes. Semi-autonomous, or human in the loop: it suggests resolutions and drafts emails, and a rep reviews and approves. Fully autonomous: it acts end to end. Start semi-autonomous. You build trust with operations and legal, and you collect real data on how often reps accept the drafts unchanged before letting the agent send on its own. When you're ready, fully autonomous needs an application user with the Customer Service Representative role and a shared mailbox so email comes from a central address.

Source: Set up Case Management Agent to resolve cases — https://learn.microsoft.com/dynamics365/customer-service/administer/set-up-case-resolution-agent

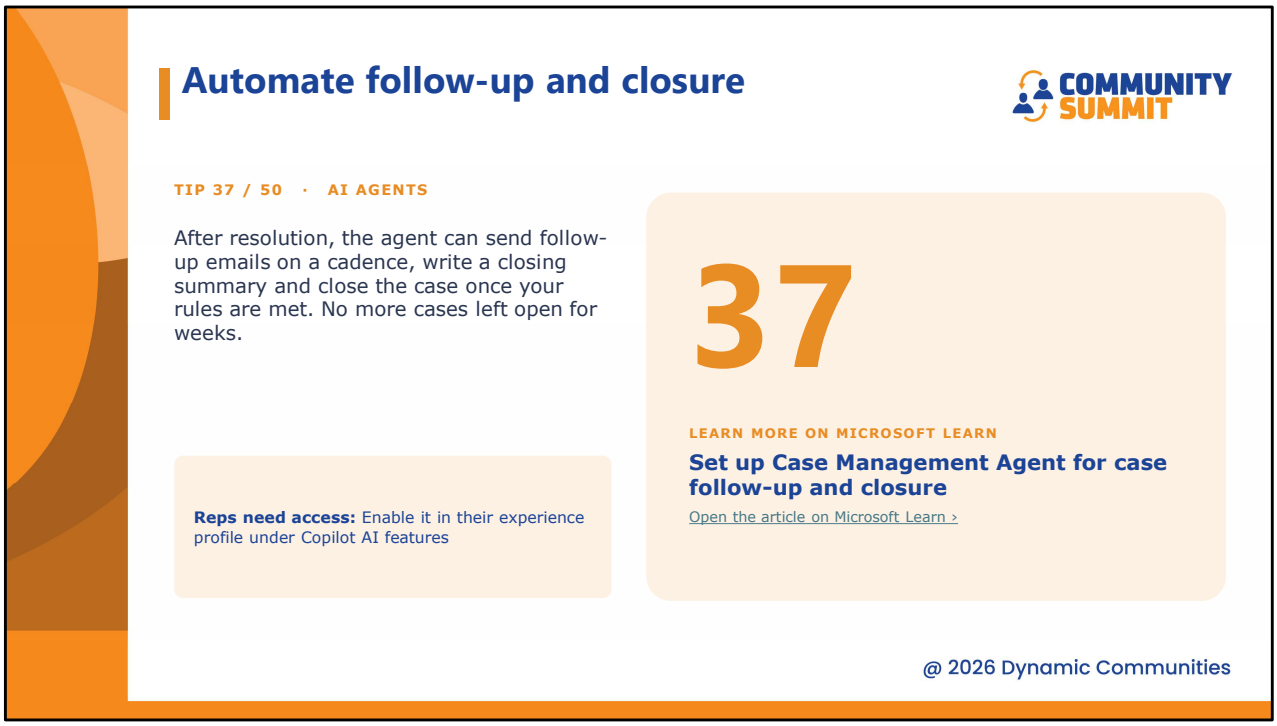

Shadow mode is the safest way to evaluate the agent. It makes its predictions but doesn't act on them, so you can compare what the agent would have filled in against what reps actually chose. You can also simulate case-resolution flows before you put them into production. Both arrived in 2026 release wave 1. Use the comparison to decide field by field and case type by case type where you're comfortable automating. It's also very persuasive evidence for a skeptical operations lead.

Source: Set up Case Management Agent to resolve cases — https://learn.microsoft.com/dynamics365/customer-service/administer/set-up-case-resolution-agent

Lots of teams have a shared support mailbox and someone whose job is to triage it by hand every morning. The Case Management Agent can classify incoming email into predefined categories and, since August 2026, subcategories too. Predefined categories went GA in April. The category then drives routing and automation, so emails land in the right queue and the right rules fire without manual triage. Start with the categories you already use informally, and review misclassified emails for the first few weeks.

Source: Configure email classification — https://learn.microsoft.com/dynamics365/customer-service/administer/configure-email-classification

Every service team has a backlog of cases waiting on the customer. Follow-up and closure lets the agent send follow-up emails on a cadence, write a closing summary and close the case once your rules are met. Microsoft's example: for Contoso Coffee cases older than seven days with status On Hold, send three follow-ups 48 hours apart, then close if there's no response. Like resolution, it can run semi or fully autonomous. Reps need it enabled in their experience profile under Copilot AI features before they'll see it.

Turn closed cases into knowledge

COMMUNITY SUMMIT

TIP 38 / 50 · AI AGENTS

The Customer Knowledge Management Agent analyzes closed cases, drafts or updates knowledge articles and helps fill gaps, so knowledge keeps up with real issues.

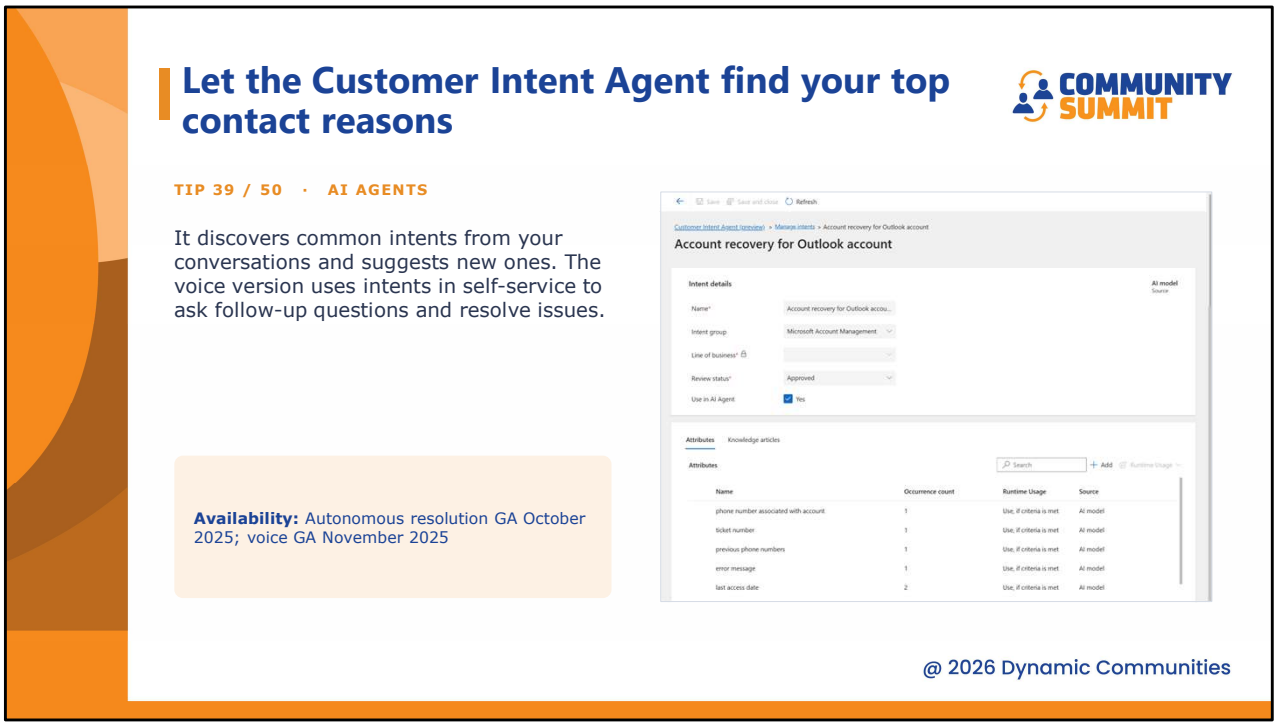

Availability: Generally available since October 2025

@ 2026 Dynamic Communities

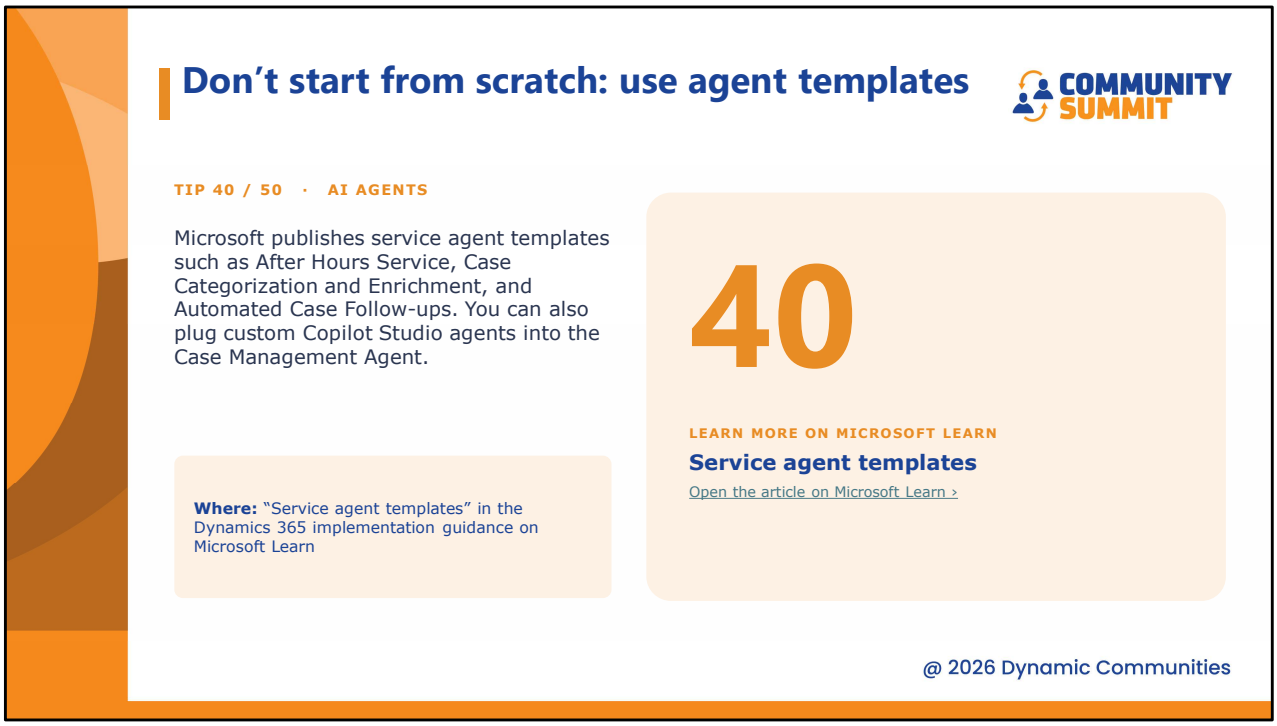

Knowledge bases go stale because writing articles is nobody's favorite job. The Customer Knowledge Management Agent analyzes resolved cases, drafts new articles or updates existing ones, and helps fill gaps, with a human reviewing before publishing. On screen is a knowledge proposal drafted from a case, with issue, cause and resolution already filled in. It's been GA since October 2025. This feeds straight back into tip 23: better knowledge means better Copilot answers, which means fewer cases. It's a virtuous loop if you keep the review step.

Source: Manage Customer Knowledge Management Agent — https://learn.microsoft.com/dynamics365/customer-service/administer/admin-km-agent

The Customer Intent Agent reads your conversations and cases and discovers the common reasons people contact you, then suggests new intents as patterns emerge. Each intent, like the one on screen, carries the attributes the agent should collect, such as ticket number or phone number. The voice version uses those intents in self-service to ask follow-up questions and resolve issues before a human is needed. In my experience this is often the first time a team sees its real contact-reason distribution rather than what the dropdown says.

Source: Manage Customer Intent Agent — https://learn.microsoft.com/dynamics365/contact-center/administer/manage-customer-intent-agent

Last tip in the agents block. Microsoft's implementation guidance includes a set of service agent templates: Case Categorization and Enrichment, Automate Routine Queries, After Hours Service, Automated Case Follow-ups, Service Quality Evaluation and others. They're published to the Dynamics 365 FastTrack Implementation Assets repo on GitHub and added gradually, and several are still marked not available yet, so check the page for current status. You can also plug your own Copilot Studio agents into the Case Management Agent for scenarios the templates don't cover.

Source: Service agent templates — https://learn.microsoft.com/dynamics365/guidance/agent-templates/service-agent-templates

Final block: the supervisor and admin view. Quality evaluation and real-time coaching, guardrails on outbound email, recording, admin automation, user management, metrics, data masking, and finally where to track what's coming next now that release plans have stopped.

Most QA teams sample a tiny percentage of interactions because manual review is expensive. The Quality Evaluation Agent assesses cases and conversations against the evaluation criteria your supervisors define, either autonomously or as AI-assisted reviews that a person finalizes. Closed conversations went GA in January 2026 and batch evaluation in May. The thing to do first: write the evaluation criteria with your QA team. The agent is only as good as the rubric you give it, and vague criteria produce vague scores.

Coach in the moment with the Quality Assurance Agent

COMMUNITY SUMMIT

TIP 42 / 50 · SUPERVISORS, QUALITY AND ADMIN

It analyzes live conversations against quality and compliance rules, then nudges reps with real-time coaching and alerts supervisors to compliance risks.

Availability: GA June 2026, Dynamics 365 Contact Center only

@ 2026 Dynamic Communities

Tip 41 looked backwards; this one works during the conversation. The Quality Assurance Agent analyzes live conversations against your quality and compliance rules and nudges the rep in real time, like the coaching cards on screen with a suggested response the rep can use or dismiss. It also alerts supervisors when there's a compliance risk. GA since June 2026, Contact Center only. The pitch to supervisors is simple: fix the issue during the call rather than in next week's one-to-one.

Source: Use Quality Assurance Agent — https://learn.microsoft.com/dynamics365/contact-center/administer/use-quality-assurance-agent

Governance policies check outbound email, both the body and attachments, against your rules before it goes out, whether a human or an AI agent wrote it. You decide whether a violation is just logged or blocked. Think personal data in attachments, promises you can't make, or competitor mentions. This ties back to tip 34: it's your safety net before you let agents send email fully autonomously. Define a small set of high-value policies first and run them in log mode to see what they catch.

Use screen recording to see the whole workflow

COMMUNITY SUMMIT

TIP 44 / 50 · SUPERVISORS, QUALITY AND ADMIN

Transcripts show what was said; screen recordings show what the rep did. Recording can start automatically on voice calls, and you can choose which monitors are captured.

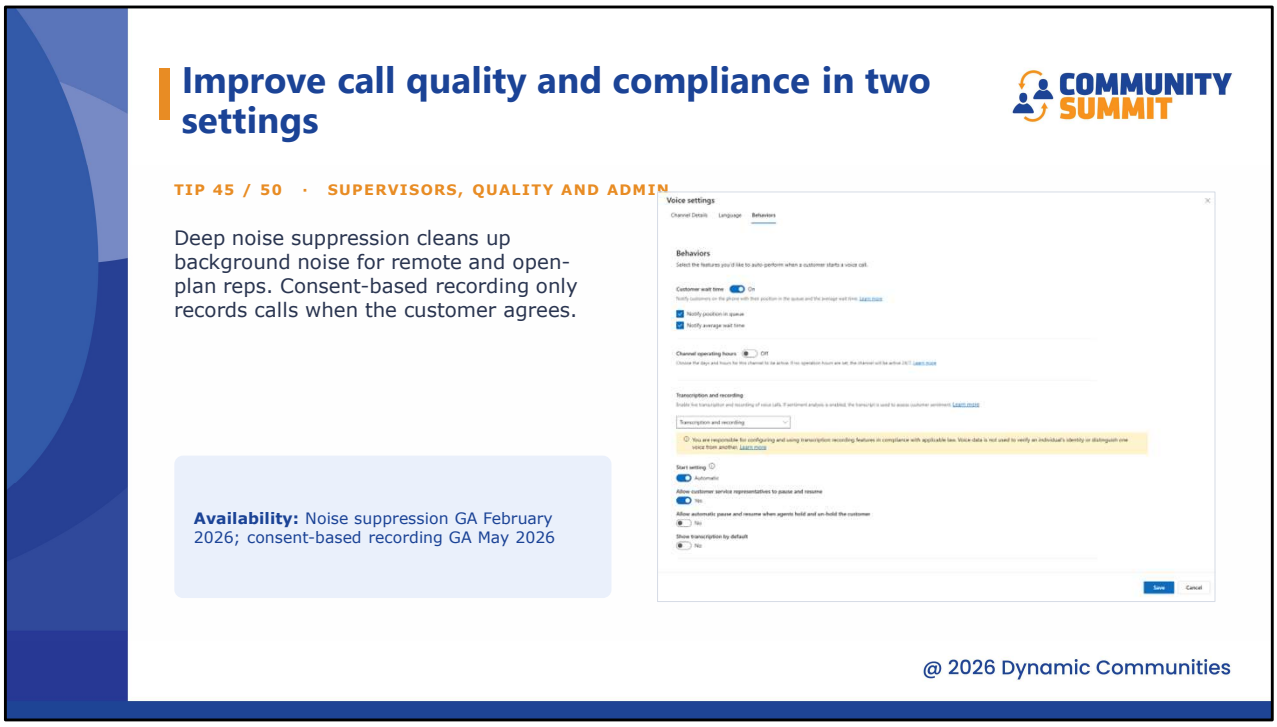

Tell your reps: A red border shows which screen is being recorded.

@ 2026 Dynamic Communities

Transcripts tell you what was said; screen recordings show what the rep actually did, which is where you find process problems like ten clicks to issue a refund. Screen recording uses the desktop companion application, can start automatically on voice calls, and lets you choose which monitors are captured. On screen you can see the recording controls in the communication panel. Tell your reps that a red border shows which screen is being recorded. And please check local privacy and works council requirements before you switch it on.

Source: Configure screen recording with desktop companion application — https://learn.microsoft.com/dynamics365/contact-center/administer/configure-screen-recording

Two voice settings, both admin-enabled. Deep noise suppression cleans up background noise for reps working from home or in open-plan offices, and customers notice the difference. It went GA in February 2026. Consent-based recording only records the call when the customer agrees, which simplifies compliance in regions that require consent. That went GA in May. On screen are the voice workstream behaviors where recording and transcription are configured. Small settings, but both reduce complaints.

Source: Enable call recording and transcription for voice — https://learn.microsoft.com/dynamics365/customer-service/administer/voice-channel-configure-transcripts

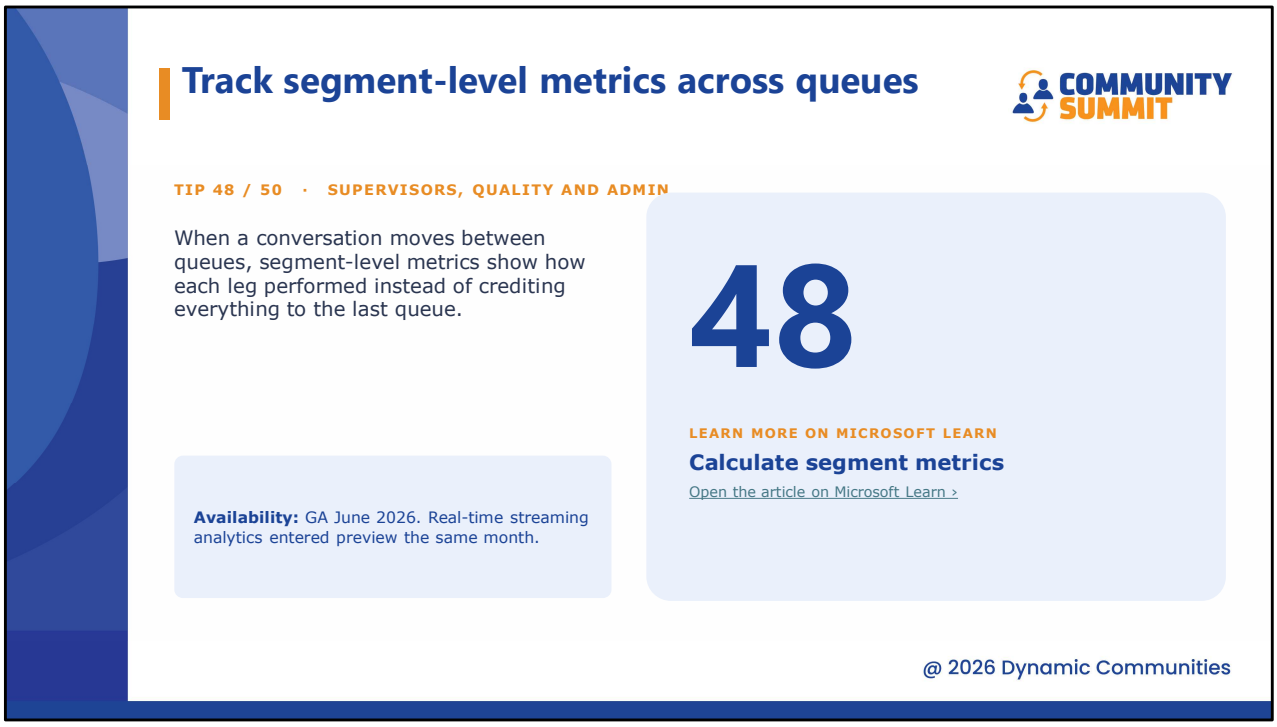

Admins get an agent too. The Service Operations Agent lets you set up and check your contact center in natural language: create a voice workstream, create a queue with highest-capacity assignment, list queues that aren't connected to any workstream, find your organization ID. It runs the steps with a human in the loop through a Dataverse MCP connection, launched from the Conversational Setup tile in the admin center. GA since July 2026. Also worth a look: agentic simulations, in preview, to test your contact center setup with AI-generated conversations.

Source: Use Service Operations Agent — https://learn.microsoft.com/dynamics365/contact-center/administer/use-service-operations-agent

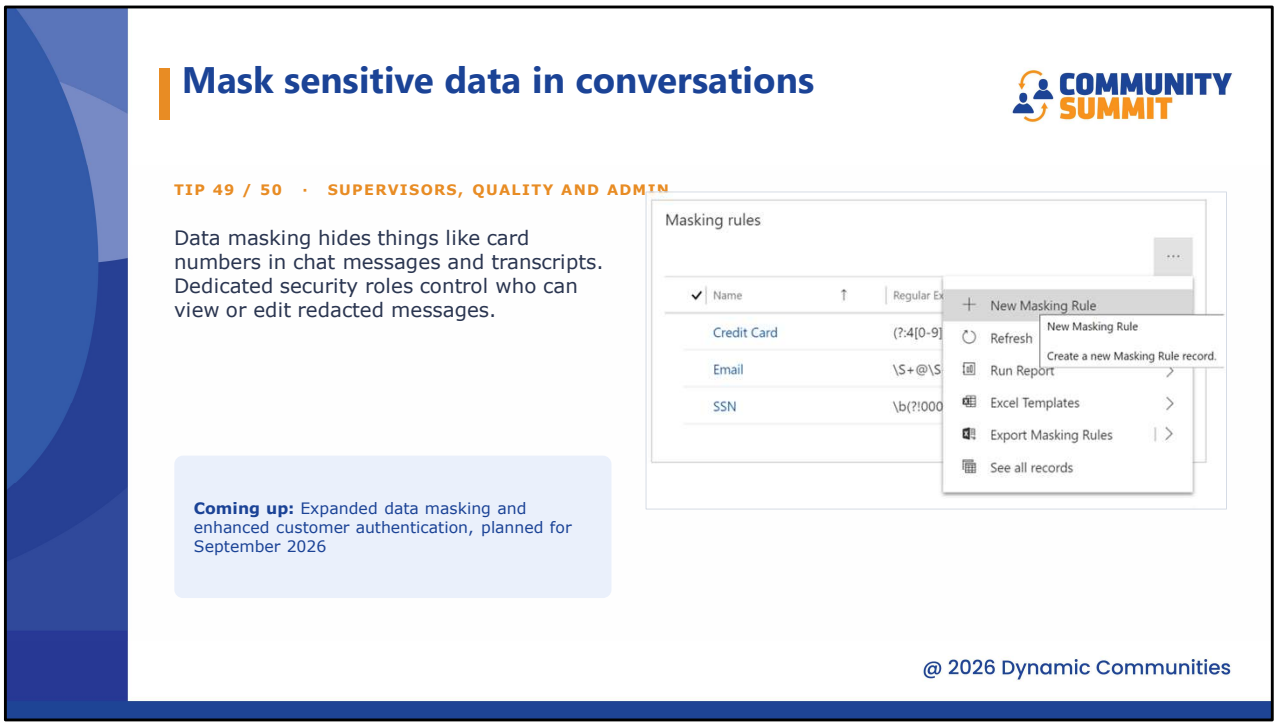

Large contact centers onboard and offboard reps constantly, and assigning roles one user at a time doesn't scale. Now you link a Microsoft Entra security group to a Dataverse team, assign roles like Basic User, Customer Service Representative and Omnichannel agent to the team, and every member inherits them, including queue participation and presence. Add someone to the group and they're ready; remove them and access goes. GA since July 2026. Recent updates also give new reps predefined capacity so they're ready for assignments on day one.

Source: Assign roles and enable users — https://learn.microsoft.com/dynamics365/customer-service/implement/add-users-assign-roles

When a conversation is transferred from queue A to B to C, traditional reporting tends to credit everything to the last queue, which hides where the problem started. Segment-level metrics break the conversation into legs and show how each one performed: wait time, handle time and outcome per queue. GA since June 2026, with real-time streaming analytics entering preview the same month. This finally answers the question every operations manager asks: which queue is actually causing the transfers?

Source: Calculate segment metrics — https://learn.microsoft.com/dynamics365/contact-center/extend/calculate-segment-metrics

Customers will type card numbers into chat no matter what you tell them. Data masking rules, defined as regular expressions like the credit card, email and SSN rules on screen, hide that data in messages and transcripts. Dedicated security roles control who, if anyone, can view or edit the redacted content. Expanded data masking and enhanced customer authentication were planned for September 2026, so confirm the current status in your tenant before presenting those as live.

Source: Create and manage data masking rules — https://learn.microsoft.com/dynamics365/customer-service/administer/data-masking-settings

Last tip. Many of the dates I've quoted today came from release plans, and Microsoft stopped publishing release plans in September 2026. New Dynamics 365, Power Platform and Dataverse capabilities now appear on the always-on AI at Work roadmap at aka.ms/AIatWorkRoadmap. The old release plans stay available for reference. Bookmark it, because this is how you'll keep up after today. That's fifty. Thank you, and let's take questions.

Source: AI at Work roadmap — https://aka.ms/AIatWorkRoadmap

That's fifty. Thank you. Two things to take with you: check the deprecations page this month, because conversation forecasting ends on October 30, and bookmark aka.ms/AIatWorkRoadmap to keep up with what's next. Every screenshot today came from Microsoft Learn and each slide's notes include the source link. Now, questions: shout out a tip number and we'll jump back to it.
